ABSTRACT

(Handwritten notes: B1 Sub C5)

A mounting structure for at least one display board providing a first mounting interface and a second mounting interface is disclosed. The mounting structure includes a first pivotal interface and a second pivotal interface. The first pivotal interface includes a first projection forming a retaining slot adapted to engage the first mounting interface of the display board. The second pivotal interface is adapted to engage the second mounting interface of the display board. The display board is adapted to be removably pivotally coupled to the mounting structure at both the first pivotal interface and the second pivotal interface. A mounting structure for display of at least one display board is also disclosed. The mounting structure includes a frame, and a compliant retaining system. The compliant retaining system includes a pair of spaced-apart members for the display board coupled to the frame, wherein at least one of the members is compliant. The display board can be pressed into secure engagement between the members of the compliant retaining system. A mounting structure coupled to a floor and associated with an existing structure and for use with at least one display board is further disclosed. The mounting structure includes an articulating frame and at least one display rack. The frame is pivotally coupled to the existing structure for movement between a fully deployed position and a fully stowed position. The at least one display rack is coupled to the articulating frame and provides a first interface and a second interface for pivotal coupling of a plurality of display boards.
